Response to the Editor's Comments

Comment: "We kindly ask you to revise the manuscript further in accordance with the suggestions provided."
Response: We thank the editor for the opportunity to further improve our manuscript. We have addressed the additional comments raised by Reviewer 2 by expanding the morphological descriptions of the five nymphal instars of *Monalonion dissimulatum* and incorporating detailed information on their main morphological characters, including the dorsal abdominal glandular area. All changes made to the manuscript have been highlighted in red for ease of identification.

Location: Pages 9–12, lines 266–316; Figures 4 and 5.

Response to Reviewer 2

Comment: "Although the paper has greatly improved, the descriptions of the nymphs is extremely poor, even not mentioning the Dorsal Abdominal Glands which are a key feature in immature Heteroptera. As they did with the adult, a good description needs to be provided for every instar, which can make the paper a real multidisciplinary one worthing to publish on this journal."
Response: We thank the reviewer for their comments. We have expanded the morphological descriptions of the five nymphal instars, detailing variations in dorsal pigmentation, the shape of the fourth antennomere, tibial coloration, and wing-pad development. We have also included a description of the dorsal abdominal glandular area, which is illustrated for each nymphal instar in Figure 5.

Location: Pages 9–12, lines 266–316; Figures 4 and 5.

Response to Reviewer 3

Comment: "No further comments. Well-crafted article; corrections have been made. Congratulations to the authors."
Response: We thank the reviewer for their positive evaluation of the revised manuscript and for acknowledging the improvements made. We appreciate their comments and the time devoted to reviewing our work.
